# Data Analysis: Attendance

**Format: Formula-driven spreadsheet**

**Inputs: 5 linked tabs**

**Output: Trends, final grades, recommendations**

**Author: Godhuli Vyas**

# Attendance analysis

Given a term of raw learner data across **five linked tabs**, the task was to explain how attendance moved through the term, compute a **fair comprehensive final grade** for every learner, and turn both into recommendations backed by the numbers, not opinion.

Spreadsheet | Formulas | Dashboard

## Key Insights:

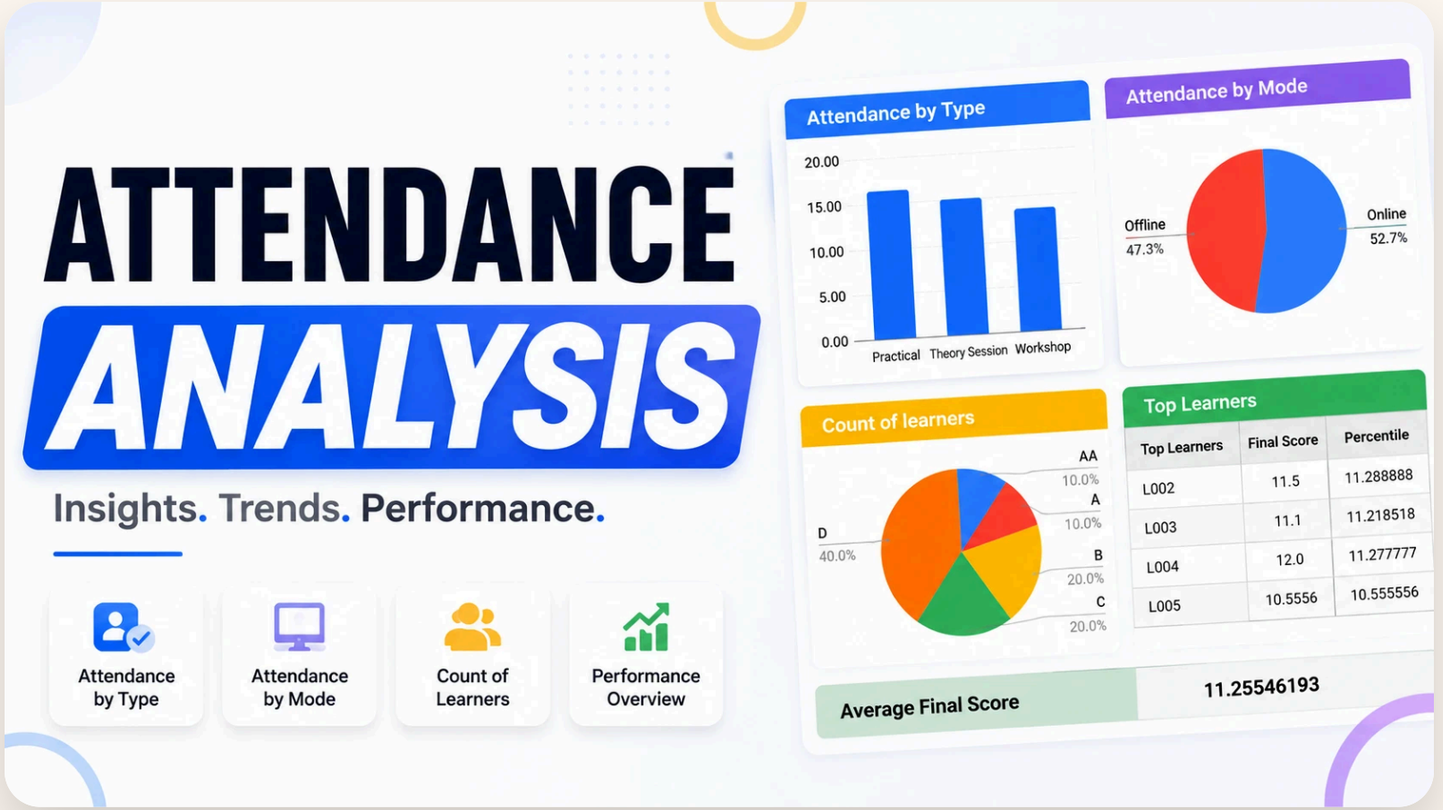

Every answer **traces back to a source cell** through formulas.

Analysis pulls across all five tabs rather than pasted values.

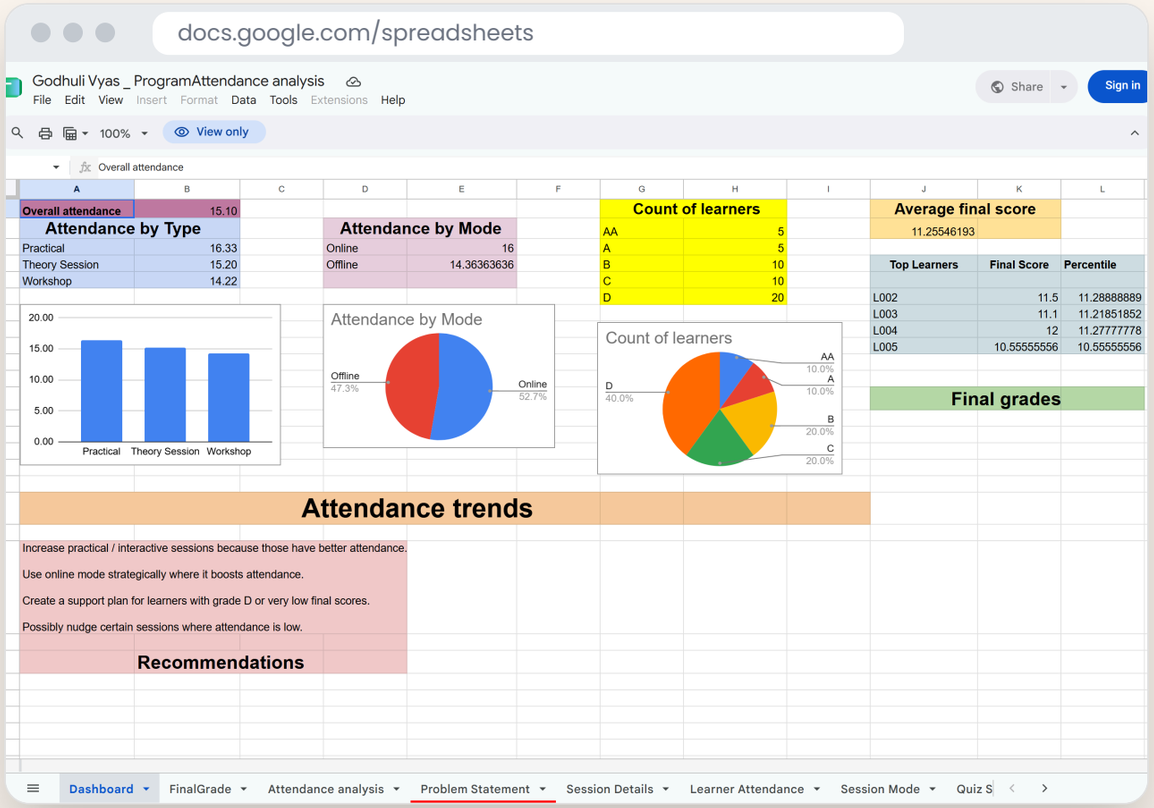

Output is a clean, formatted dashboard.

# The dashboard

Attendance by type, attendance by mode, learner count, top learners and average final score.

# The live workbook

**Attendance by type:** Practical 16.33, Theory 15.20, Workshop 14.22, against an overall 15.10.

**Attendance by mode:** online 52.7%, offline 47.3%.

**Final grades:** AA 5, A 5, B 10, C 10, D 20 learners, with an average final score of 11.26.

Grade D is the largest group (40%).

**Solution:** Shift effort to practical formats and to the learners in grade D.

# Three questions, one dataset

1

## Trend

How does attendance change over the term, and what influences it?

2

## Final grade

A grade (AA, A, B, C, etc.) for every learner, across subjects, not just one quiz.

3

## Recommendations

How to improve attendance and scores, with the data backing each one.

# Five tabs, one linked model

| Tab | What it holds |
| --- | --- |
| **Learner Attendance** | Attendance detail for every learner, across every session |
| **Session Details** | Subject, instructor and session type, in term sequence |
| **Session Mode** | Delivery mode (online / offline) per session |
| **Quiz Scores** | Post-session quiz scores out of 20; absentees can attempt, with a 5-mark deduction |
| **Grading Criteria & Weightage** | Relative grading bands that convert scores into a final grade |

# Approach

## Attendance trend

- By session type: Practical, Theory, Workshop
- By delivery mode: online vs offline
- Read against the term timeline, not one average

## Final grading

- Quiz scores rolled up per learner across subjects
- Absentee scores carry the 5-mark deduction first
- Aggregate mapped to the relative bands (AA, A, B, C)

# From raw data to a grade

01

## Link the tabs

Formulas pull attendance, session, mode and quiz data together.

→

02

## Apply deduction

Absent-but-attempted quizzes lose 5 marks.

→

03

## Aggregate

Scores rolled up per learner across all subjects.

→

04

## Grade

Mapped to the bands in Grading Criteria & Weightage.

# Recommendations

## Fix weak session types first

Attendance is not flat across types. Where the drop is steepest (workshops, in this dataset) change scheduling, timing or format first.

## Treat mode as a lever

With attendance split nearly evenly online and offline, favour the format with the better attendance-to-score link for sessions learners tend to skip.

## Target the bottom of the curve

Low final grades that also carry low attendance are the clearest group for outreach.

# Thank you for reading.
