Teardown: Automon

Device: Web and mobile browser

Goal: One clear view of a no-code automation, from trigger to team alert

Read: 4 minutes

Author: Godhuli Vyas

Automon's Overview

Automon

Automon Dashboard is a **no-code monitor** that turns scattered automation triggers into one clear data flow. It shows what fired, where the data went and who was told, on a single screen.

Zapier | Google Sheets | Email alerts | No-code | Real-time

Key Insights:

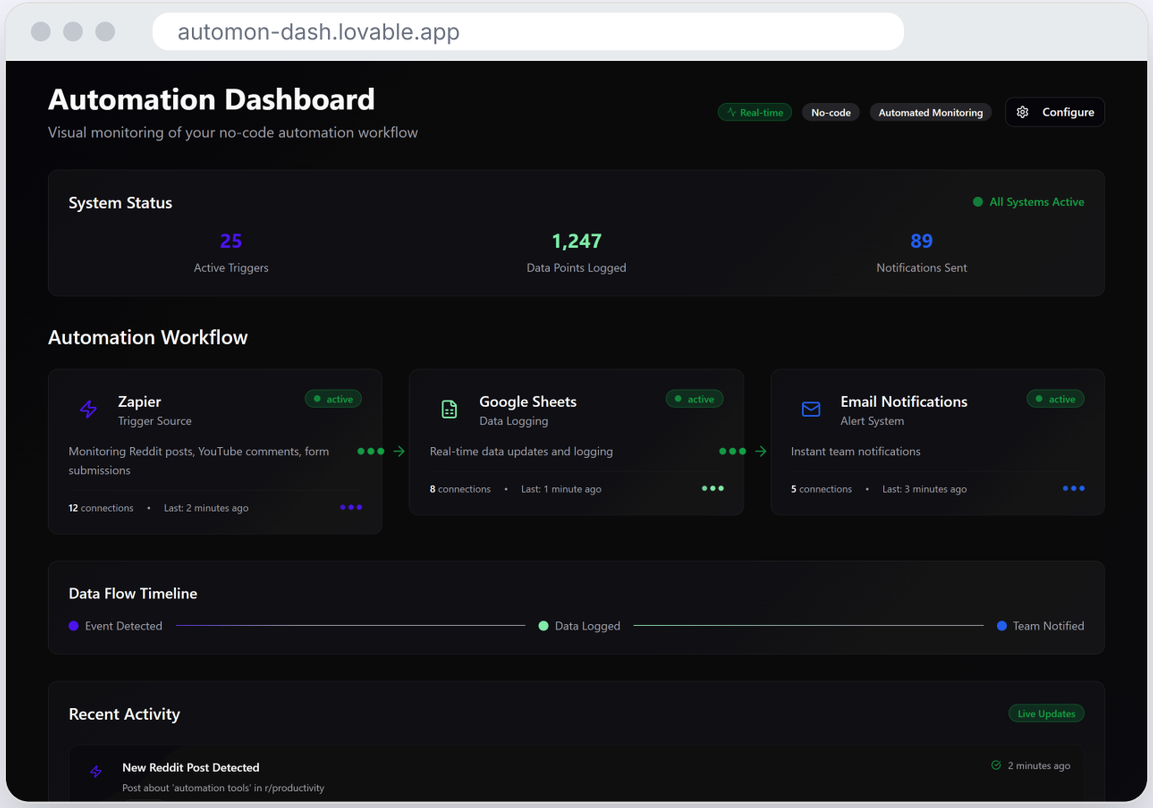

25 active triggers and **1,247 data points logged** sit at the top as the headline status.

The flow is three steps: **Zapier trigger, Google Sheets log, email notification.**

A **Recent Activity** feed lists each event with its source tag and how long ago it ran.

User Journey: system status

Automon

The first block answers "is it working?": **All Systems Active**, with **25 Active Triggers, 1,247 Data Points Logged and 89 Notifications Sent.**

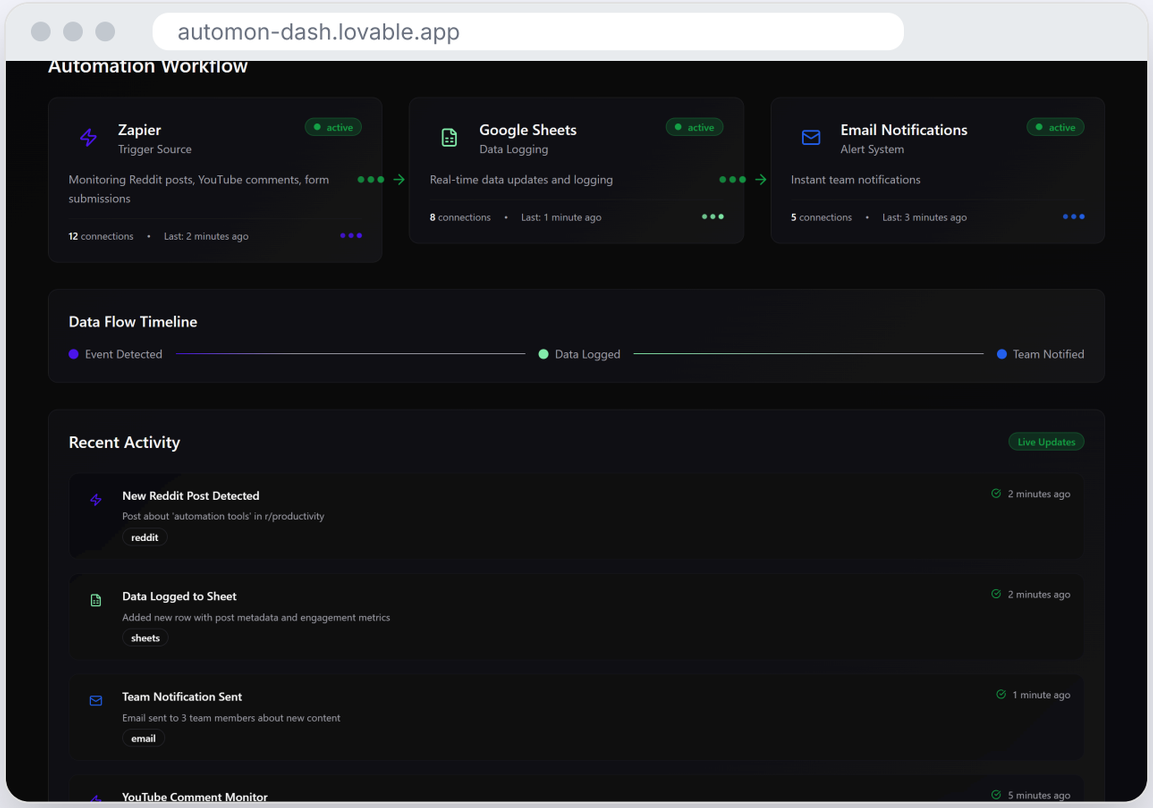

Header tags (**Real-time, No-code, Automated Monitoring**) set expectations before any detail.

Three numbers, three colours, no chart to decode. **But the numbers carry no time range, so 25 could be today or all time.**

Solution: Add a time range next to each headline number.

User Journey: the workflow

Automon

The workflow reads left to right as three cards: **Zapier (Trigger Source), Google Sheets (Data Logging), Email Notifications (Alert System).**

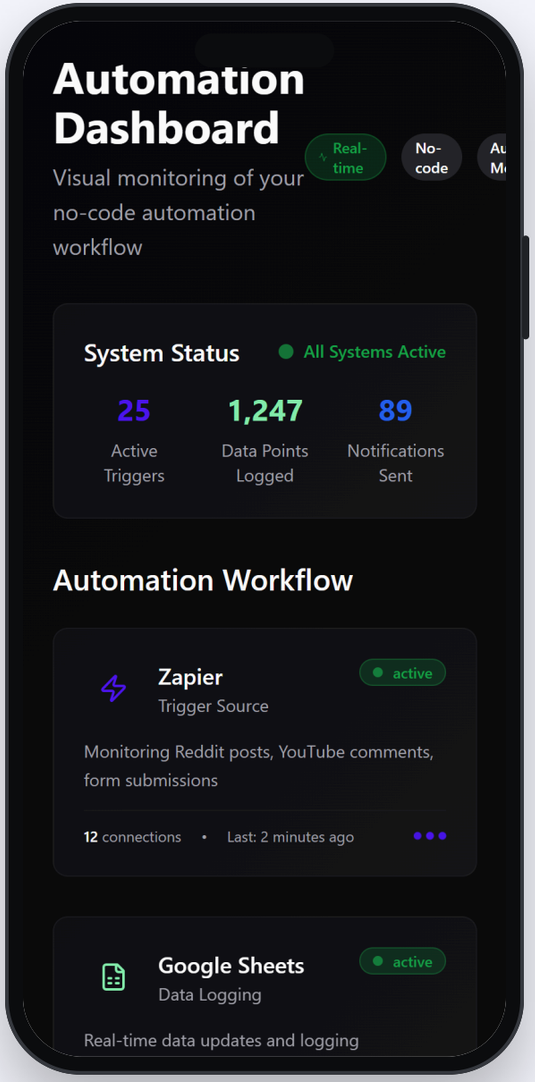

Each card carries a status pill, a **connection count (12, 8, 5)** and a **last-run time**, so health is visible without opening anything.

A **Data Flow Timeline** (Event Detected, Data Logged, Team Notified) restates the same path in one line.

Solution: The same three-step story is told at three levels of detail, so a non-technical owner can follow it.

User Journey: recent activity on mobile

Automon

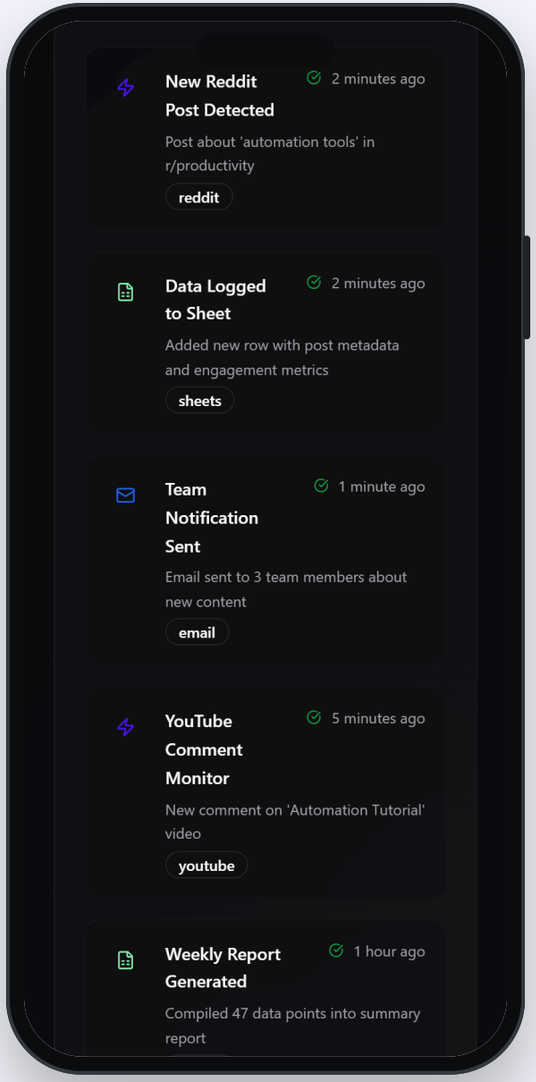

Status and workflow

On a phone the three cards stack in one column and the status numbers stay on one row.

Recent Activity lists events such as a **new Reddit post detected, data logged to a sheet, team notification sent**, each with a source tag.

A **Live Updates** badge tells the user the feed refreshes on its own.

Solution: Stacking, not shrinking: the story survives the small screen.

Recent activity

How it works

Automon

01
Trigger
Zapier watches Reddit posts, YouTube comments and form submissions.

→

02
Log
Google Sheets records real-time data updates.

→

03
Notify
Email alerts go to the team instantly.

→

04
Monitor
The dashboard shows status, last run and recent activity.

No code at any step. The dashboard reads the state of the automation; it does not replace it.

Automon

Core advantages

1

One screen

Trigger, log and alert are visible together instead of in three separate tools.

2

Health at a glance

Status pills, connection counts and last-run times show what is alive.

3

No code to read

Plain labels and a left-to-right flow that a non-technical owner can follow.

The numbers on screen

25

Active triggers

1,247

Data points logged

89

Notifications sent

Read from the live dashboard.

Proposed success metrics

Automon

NORTH STAR METRIC

Automations that run without a failure each week (Proposed)

Proposed: a monitor earns its place if owners can trust the green status.

L1 METRIC (PROPOSED)

Time from a failed trigger to the team being notified.

L2 METRIC (PROPOSED)

Share of logged data points that reach a notification when they should.

Thank you for reading.
