PRD: HumanNessAI

Device: Low-end Android phone and admin web

Goal: Teach models what India actually looks like

Read: 5 minutes

Author: Godhuli Vyas

HumanNessAI's Overview

HumanNessAI

Modern AI models perform well on global datasets but often fail to recognise **culturally and geographically relevant elements from India:** rural infrastructure, regional practices, local environments. HumanNessAI, for Josh Talks, builds **large-scale vision datasets sourced directly from every district.**

Image collection | Offline-first | Regional languages | Review queue

Key Insights:

The gap is missing data, not missing models, so the fix is a data platform.

Goal: a scalable, inclusive, quality-driven system that supports contributors in low-resource environments.

Internal teams validate efficiently, so the datasets stay **reliable for training AI models.**

Who it is for

C

Contributor

Persona 1

A rural student or gig worker on a **low-end Android phone** with intermittent internet. Wants to earn money or contribute to meaningful work. Pain points: **low connectivity, language barriers, unclear instructions.**

N

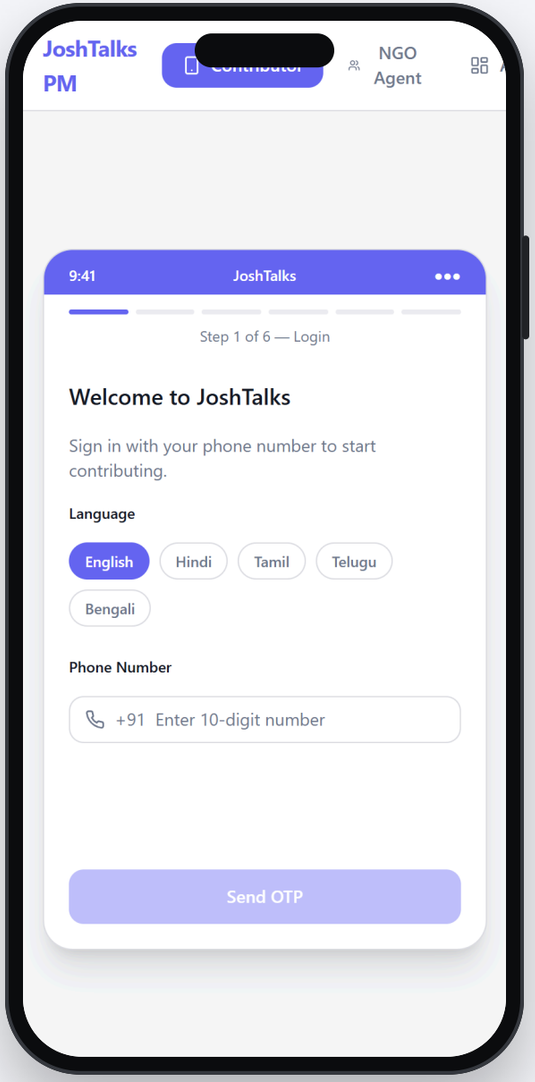

NGO Field Agent

Persona 2

Works in rural programs on a mid-range smartphone with moderate connectivity. Impact-driven and prefers **structured work,** collecting in batches.

User Journey: the contributor

HumanNessAI

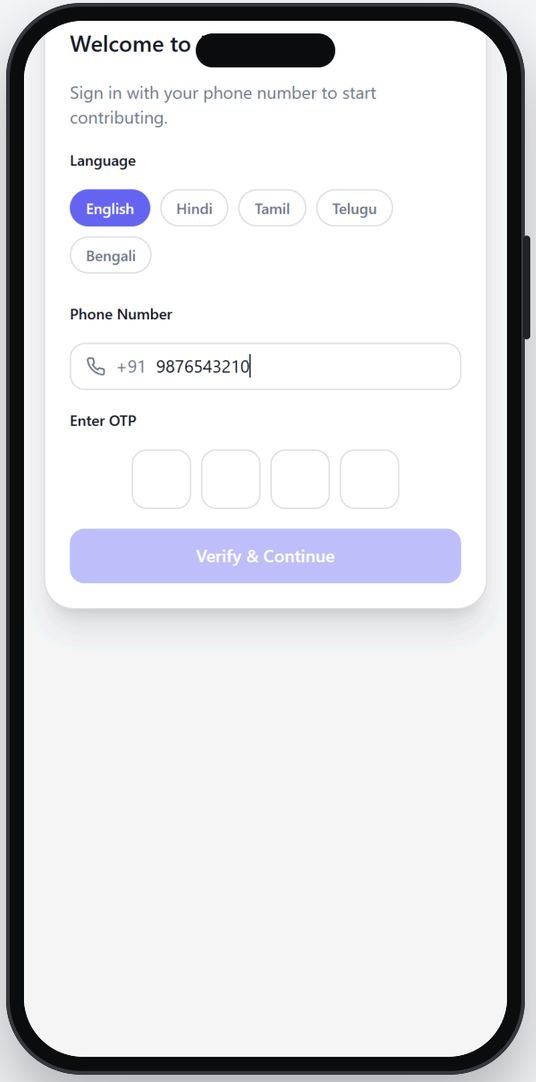

Step 1: language and phone

A six-step flow starts with **login by phone number,** no email or password.

The user picks a language first: **English, Hindi, Tamil, Telugu or Bengali,** matching the language-barrier pain point.

A one-time code verifies the number. **Unclear instructions are still a risk until the later steps are tested with real contributors.**

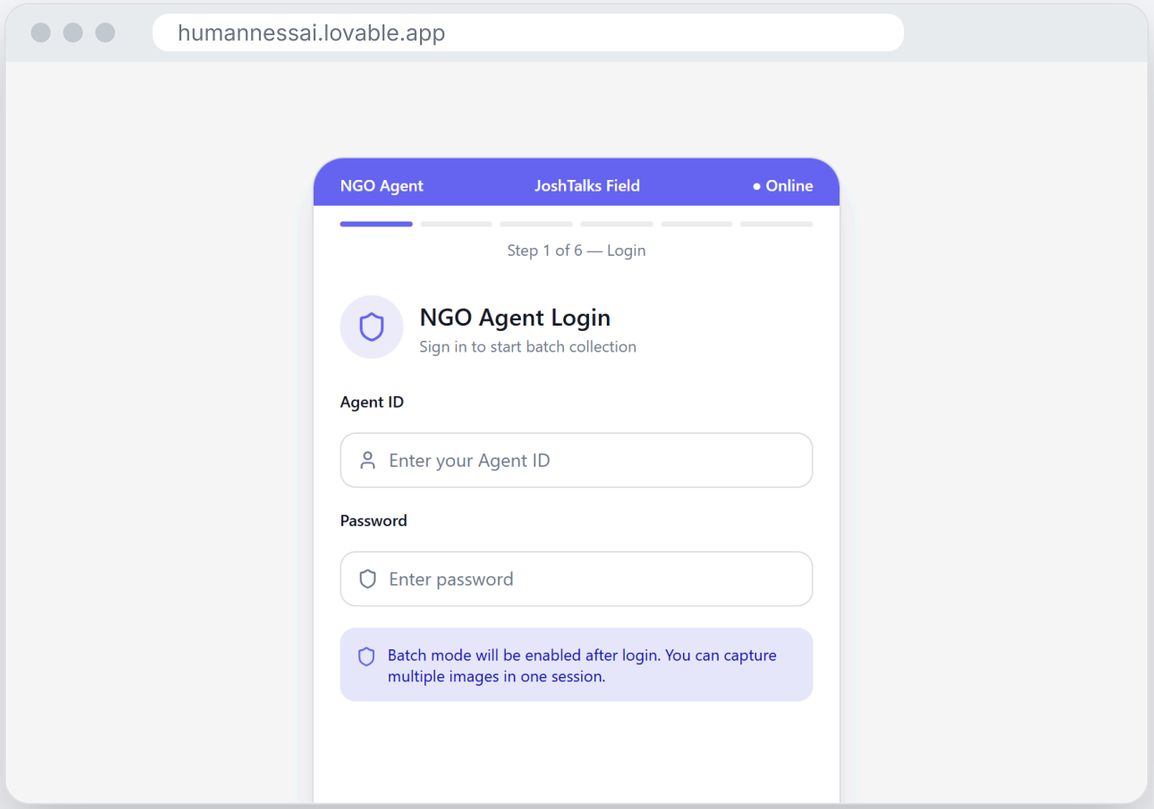

Solution: Language before login, one task per screen, a progress bar so users know how far they are.

Step 1: OTP

User Journey: the NGO field agent

HumanNessAI

A separate **NGO Agent** flow, also six steps, starts with an Agent ID and password.

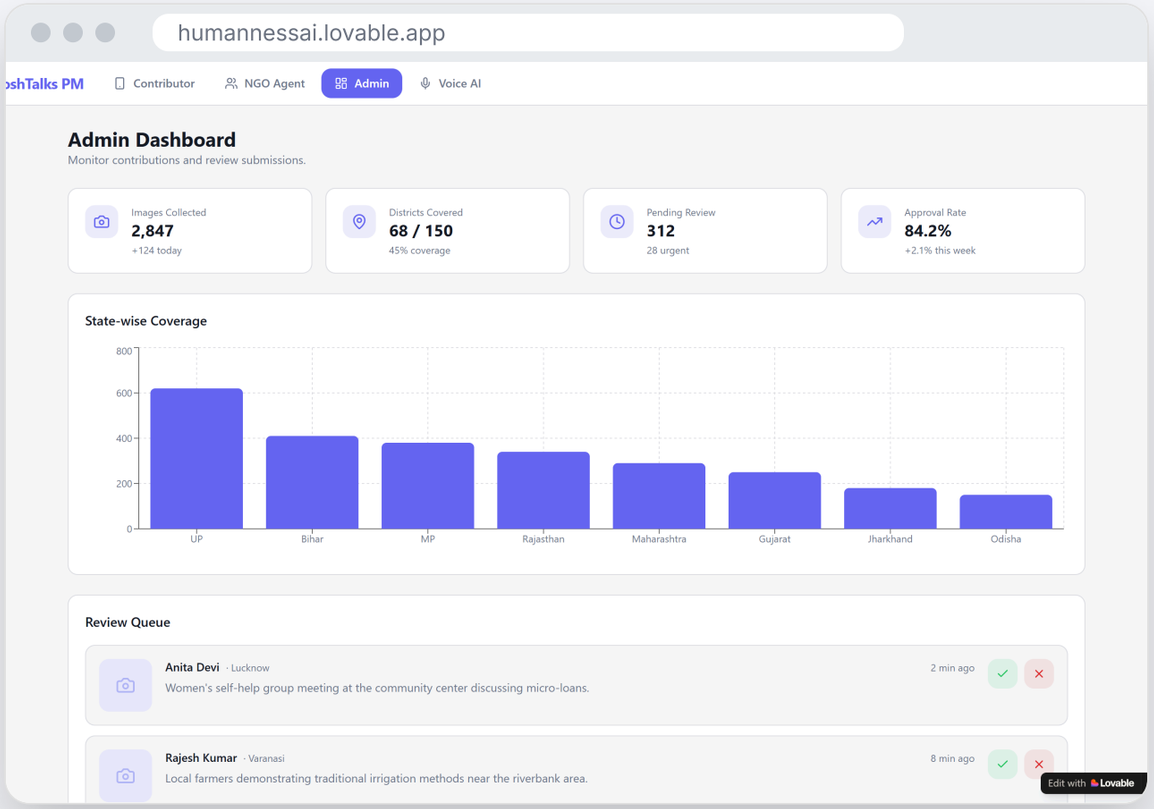

The login explains the difference up front: **batch mode** is enabled after login so an agent can **capture multiple images in one session.**

It serves the agent persona: structured, repeatable work in the field. **Agents and contributors are kept apart, so a shared device needs a clear switch.**

Solution: Proposed: remember the last agent on a shared phone to speed up the daily login.

User Journey: admin review

HumanNessAI

The reviewer side tracks **supply, coverage and quality** in one view: images collected, districts covered, pending review and approval rate.

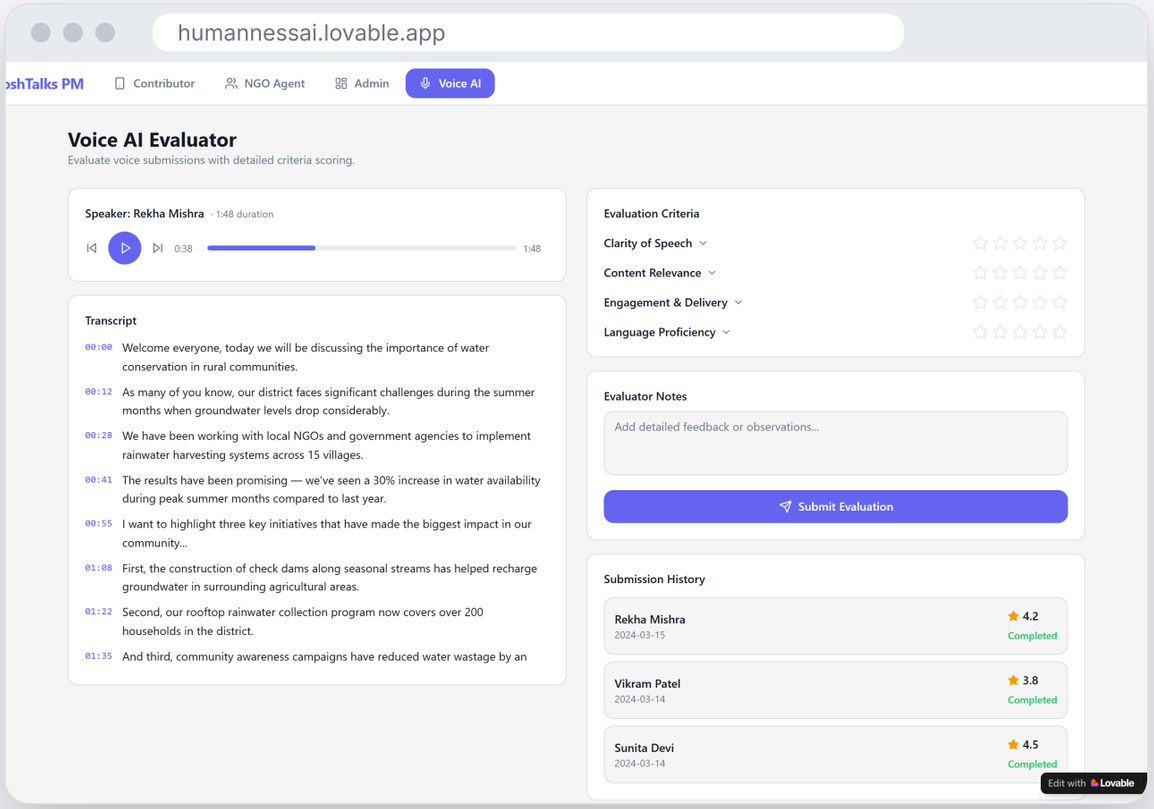

A **state-wise coverage** chart shows which regions are filling up and which are behind.

A **review queue** lets a reviewer approve or reject each submission in one tap. **The numbers shown are sample data in the MVP, not real collection results.**

Solution: Review time per submission is a PRD target: under 45 seconds.

User Journey: Voice AI

HumanNessAI

The MVP also has a **Voice AI Evaluator:** audio player, timed transcript and a speaker header.

Reviewers score on four criteria: **clarity of speech, content relevance, engagement and delivery, language proficiency.**

Evaluator notes and a submission history sit alongside. **This tab goes beyond the image-collection PRD; the data shown is sample content.**

Solution: It shows the same review pattern can extend from images to voice.

PRD success metrics (1 of 2)

HumanNessAI

Category	Metric	Target	Why it matters
Supply	Daily uploads	50,000	Indicates platform scale and contributor activity.
Coverage	District completion	100% in 12 months	Measures mission completion and geographic reach.
Coverage	Images per village	1,000	Ensures dataset depth for training.
Quality	Approval rate	> 85%	Maintains dataset accuracy and reliability.

PRD success metrics (2 of 2)

HumanNessAI

Category	Metric	Target	Why it matters
Quality	Auto-rejection rate	< 15%	Indicates input quality and contributor guidance.
Efficiency	Review time per submission	< 45 sec	Ensures scalable review operations.
Engagement	Contributor retention, week 2	> 40%	Measures stickiness and long-term engagement.
Reliability	Offline sync success rate	> 95%	Ensures usability in low-connectivity regions.

Thank you for reading.
