Audit & PRD: Kasparro

Client: Orivane (air purifier brand)

Surface: AI-search brand visibility audit

Output: Verdict + Consistency Gate PRD

Author: Godhuli Vyas

Audit the audit

Kasparro

A client report claimed Orivane won **87% of AI-search mentions.** Before it went out, I checked the underlying workbook against its own execution logs and found **20 confirmed errors**, three of which quietly inflated the best result. Then I specced the tool that catches this automatically next time.

Workbook vs logs | Verdict | Consistency Gate PRD

Key Insights:

20 of 20 errors confirmed out of everything tested.

Verdict: **partially re-run.** Fix part of it, do not send it, do not redo it all.

Output: a verdict, corrected client intelligence and a **Consistency Gate PRD.**

The verdict

Kasparro

20 / 20

Confirmed errors

4

Need a full re-run

Cannot be fixed by editing a spreadsheet

16

Fixable on existing data

Two tests were logged as answered from memory, but the execution data shows they looked things up online and attached sources. One test is the opposite: logged as searched, with zero sources. One question was never run on the target model, and one test was an accidental duplicate.

Three errors that matter most

Kasparro

1

The one clean #1 may not be real

It comes from a run whose own log contradicts itself about how the answer was produced. Until re-run, it cannot be shown to a client.

2

Five proof links do not prove

Citations tagged as direct support say otherwise. One claims a product "removes all wildfire smoke", but the source admits no real testing.

3

Two mislabelled tests

Prompts that named the brand were coded as unbranded, inflating the non-branded win count by three results.

Error breakdown (1 of 2)

Kasparro

What went wrong	Count	Where
Test question miscategorised	2	CMP-01, CMP-02
Source type does not match its own text	2	CIT-013, CIT-021
Same source labelled two different types	1	CIT-011, CIT-027
Claimed proof link is not real proof	5	MAP-006, 009, 013, 021, 023
Health claim treated as proven when it is not	1	MAP-014

Error breakdown (2 of 2)

Kasparro

What went wrong	Count	Where
Quoted source text is misleading	1	CIT-020
Label contradicts the actual answer text	1	RUN-016
System log contradicts itself	3	RUN-004, RUN-013, RUN-011
Same test counted twice	1	RUN-029, RUN-030
Never run on target model; wrong math base; duplicate sources counted	3	PF-02, Prelim Summary, 34 vs. 17

Corrected client intelligence

Kasparro

Know for sure

Mentioned in **25 of 27 valid tests (93%)**, not 26 of 30 (87%): that wrongly included 2 broken tests and 1 duplicate.

The data suggests

When nobody says the brand name, presence is inconsistent. The one #1 result is the one that cannot yet be trusted.

Best guess, not proven

The #1 contradiction might be a logging glitch. Cannot confirm without a re-run with full log visibility.

Still do not know

How the brand compares to competitors, or what a re-run would show. Says nothing about rankings, traffic or revenue.

Prioritised next actions

Kasparro

Audit platform

- Re-run the three broken tests and fill the coverage gap
- Fix every mislabelled test and source, then recalculate every reported number

Client website

- Fix or remove the two claims that contradict verified specs
- Review health-outcome claims: the biggest reputational risk

Independent authority

- Decide whether to pursue the certification the website implies
- Take a fresh copy of the live site before the next audit

Proposed: the Consistency Gate

Kasparro

01

Preliminary

Audit export arrives, possibly with duplicates, contradictions and wrong metrics.

→

02

Gate runs

Five parts, nine checks: workbook consistency, execution provenance, evidence and citation validation, summary metrics.

→

03

Human fixes

The tool never edits data. It flags, a person fixes the source, the gate re-runs.

→

04

Approved

Needs zero unresolved Blockers and zero unresolved Reviews. Warnings may remain.

Estimated 9 to 12 weeks to build; the miscounted-numbers fix ships first. Design goal: catch every known error type. Not yet measured on a new audit.

Proposed: guardrails and scope

Kasparro

Severity levels

- BLOCKER: stops Approved until fixed or overridden
- REVIEW: needs a recorded human decision
- WARNING: shown, does not block

Trust rules

- AI-assisted checks never show Passed
- Blocker overrides need PM sign-off, a reason and a timestamp
- Append-only audit trail

V1 scope and not building yet

V1 covers workbook, provenance, citation and summary checks. Not building: automatic health-claim scanning, live website checking, or any tool that fixes data without a human.

Thank you for reading.

DISCLAIMER

Audit findings are from my review of the Orivane audit workbook. The Consistency Gate is a proposed PRD, not a shipped product; its goal of catching all 20 error types has not been measured on a new audit.
