PRD: MiniSense

Device: Web dashboard (working prototype)

Goal: Answers from survey data that never guess to fill the silence

Package: PRD, wireframes, backlog, test plan, trade-offs, prioritisation

Author: Godhuli Vyas

MiniSense's Overview

MiniSense

MiniSense is an **AI business insights and Q&A layer** for survey data. It works out which few metrics and issues matter this period and puts them in front of the right person unasked. Any business user can also type a plain-English question and get **exact numbers and real customer quotes** back, with no spreadsheets and no SQL.

Gemini 2.5 Flash | Python / SQL metrics | Postgres + pgvector | MMR retrieval | CPU-only

Key Insights:

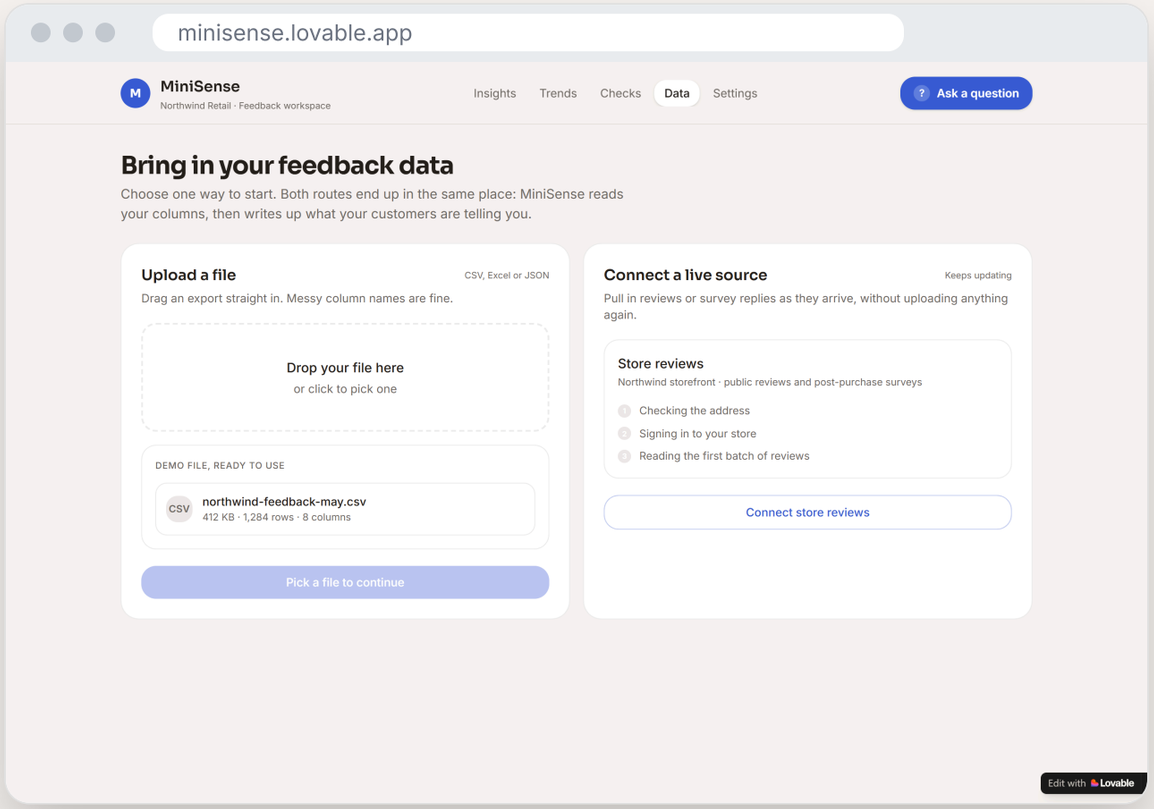

Problem: hundreds of survey responses a month, and a pattern that someone has to spot by scrolling a spreadsheet.

The bar: an answer a non-technical person would act on and could defend if challenged.

Known limit, stated plainly: it knows only your survey data and policy documents, and says so when a month has very few responses.

Prototype: bring in data

MiniSense

Two paths lead to the same place: **upload a file** (CSV, Excel or JSON, with a ready demo file) or **connect a live source** such as a store review feed.

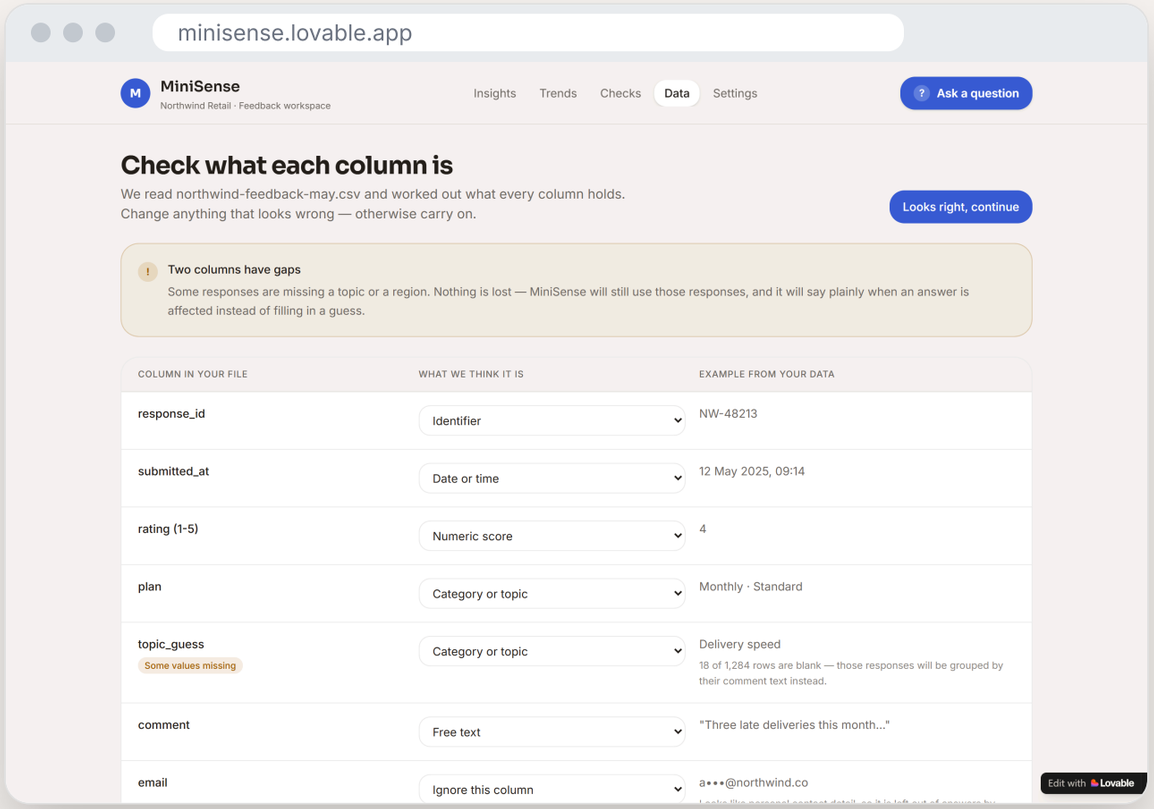

Connecting a live source shows a short progress list: checking the address, signing in, reading the first batch of reviews.

Next, MiniSense checks what each column is. **Nothing is summarised until the user confirms the guesses.**

Solution: The prototype data is sample data (Northwind Retail), so the flow can be tried without a real upload.

Prototype: reading the fields

MiniSense

Every column gets a best guess (identifier, date, numeric score, category, free text) in an **editable dropdown**, with a real example value.

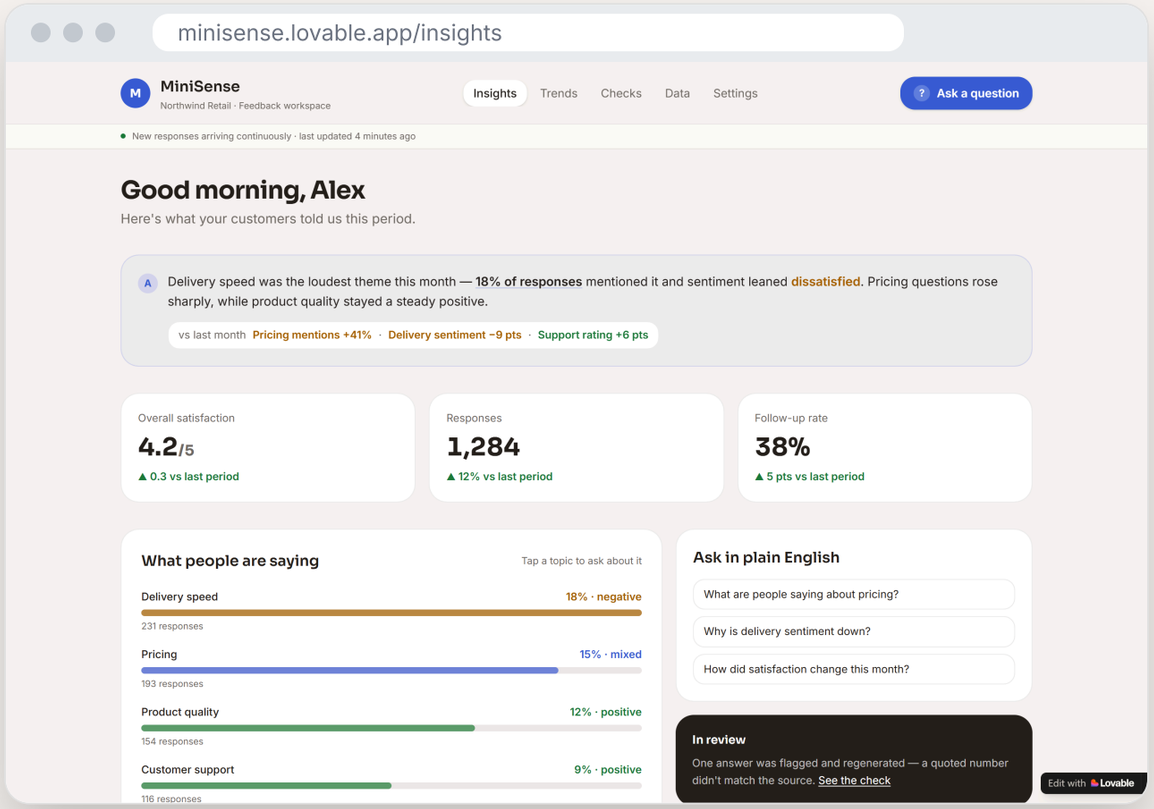

A callout flags gaps honestly: **18 of 1,284 rows are blank** in one column, and those responses are still used, grouped by comment text.

Messy exports work with no set-up. **A wrong guess would feed a wrong number later.**

Solution: Continue, then processing lands on Insights on its own.

Prototype: business insights

MiniSense

The home screen pushes insight instead of waiting for a question: a short **auto-written summary** and its change versus last period.

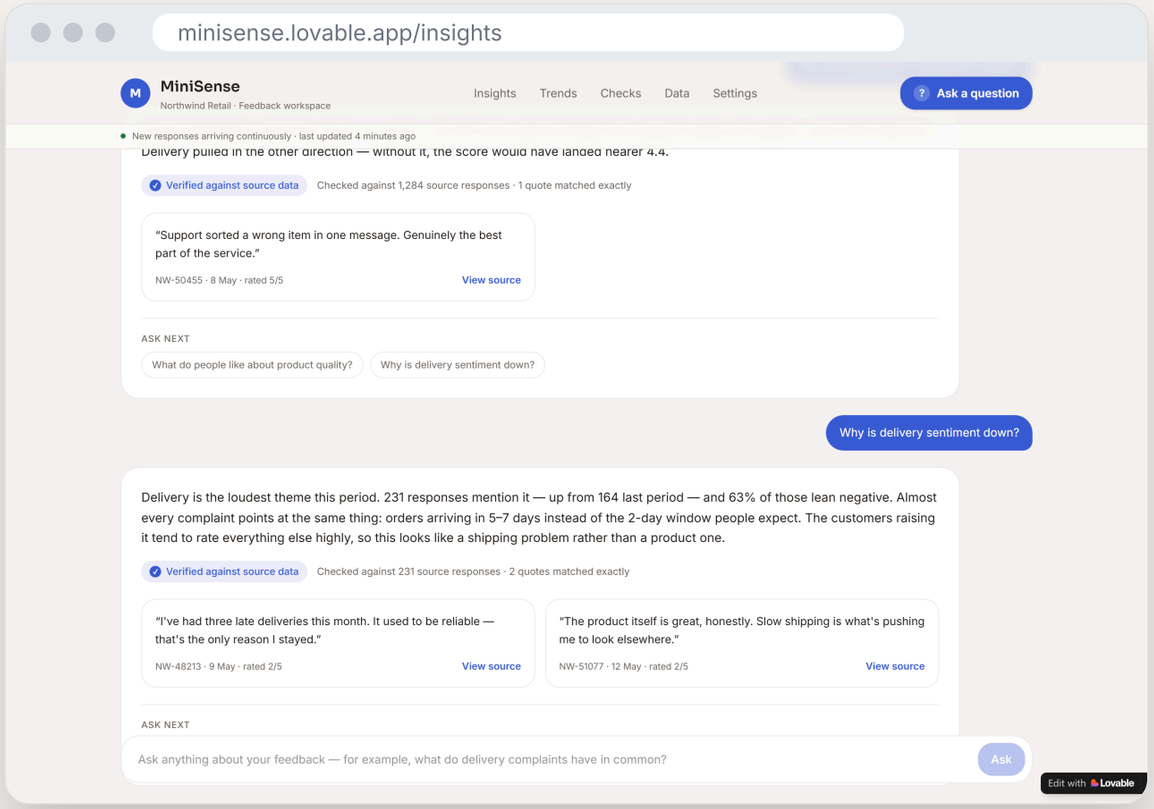

Three KPI tiles (**4.2 / 5 satisfaction, 1,284 responses, 38% follow-up rate**) each show the change against the last period.

Topic bars carry a sentiment label and response count, and each topic is tappable to ask about it directly.

Solution: Layer 1 gives the weekly answer without the user asking anything.

Prototype: ask a question

MiniSense

Question: **Why is delivery sentiment down?** The answer says 231 responses mention delivery, up from 164, and **63% lean negative.**

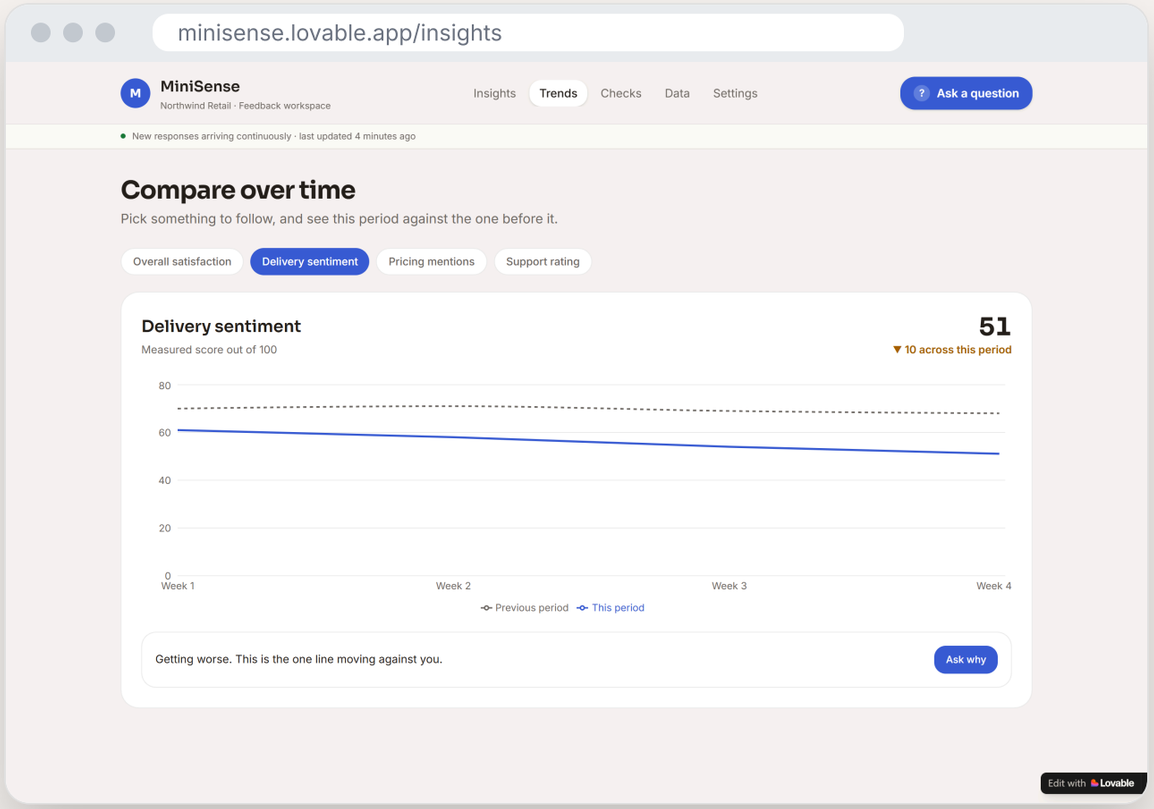

A **Verified against source data** badge shows what it was checked against: 231 responses, 2 quotes matched exactly.

Real quotes carry a record ID, date and rating plus a **View source** link, and follow-up questions keep the thread going.

Solution: Every claim is one click from the evidence behind it (FR8).

Prototype: compare over time

MiniSense

A line chart sets **this period against the one before** across four weeks for the chosen metric or topic.

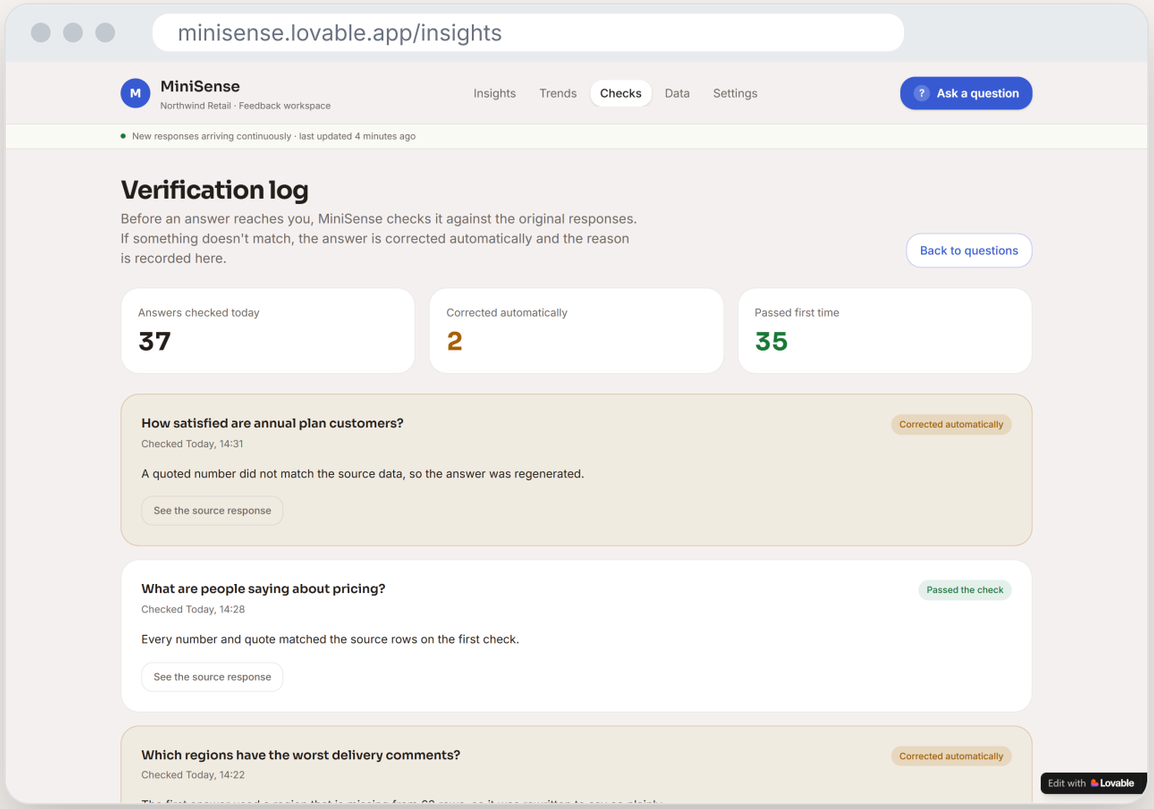

It gives the score, how much it moved and a one-line read: **getting worse, this is the one line moving against you.**

An **Ask why** button turns the trend into a chat question. **Notice it here, understand it there: two screens, one motion.**

Solution: The sample data shows delivery sentiment at 51, down 10 across the period.

Prototype: accuracy checks

MiniSense

The transparency screen behind the verified badge: **37 answers checked, 35 passed first time, 2 corrected.**

Each corrected entry gives a plain reason, for example a quoted number that **did not match the source**, so the answer was regenerated.

It is a look back, not a step forward. **It only builds trust if someone opens it.**

Solution: Verification is visible, not just claimed: this is the proof behind the badge.

Trade-off: a staged bet

MiniSense

1

Ship on a hosted model

A fast, cost-efficient model such as Gemini 2.5 Flash at MVP, on a CPU-only server. The model writes and selects evidence; it never computes numbers.

2

Learn first

Speed to learn whether people trust and use it matters more than optimising cost before the product is proven. Every production query becomes a labelled example.

3

A numeric trigger

Revisit fine-tuning only when cost per query times projected volume crosses a real share of the feature budget, set with finance, and real data exists.

Prioritisation: RICE on 40 points (top 5)

MiniSense

Feature	Pts	RICE	Class
Audit Logging	8	18.8	Must Have
Multi-Factor Authentication	8	16.0	Must Have
Dashboard Performance	13	12.5	Should (partial)
Export to Excel	5	10.0	Should Have
Single Sign-On	13	8.3	Must Have

The 40-point plan (omniXM exercise)

MiniSense

Item	Points	Why it is in
Multi-Factor Authentication	8	Compliance deadline, Security ask
Audit Logging	8	Compliance deadline, 100% confidence
Single Sign-On	13	Already cost two named enterprise deals
Export to Excel	5	Cheap, 100% confidence
Dashboard Performance, Phase 1	6	Quick wins only; remaining about 7 points next quarter

Sprint 1: top complaints, end to end

MiniSense

Story	Points	Track
E1-1 Parse question into intent	5	ML
E2-1 Compute top-N complaint topics	8	Backend
E3-1 Classify response into a topic	8	ML
E5-1 Answer view UI	8	Frontend
Total, 2 weeks, 2 backend + 1 ML + 1 frontend	29	Velocity about 30

Test plan: two kinds of testing

MiniSense

N

Numbers: unit tests

The metrics engine has no AI in it, so it is tested like normal software. Zero tolerance on any wrong number.

G

Narrative: golden set

13 golden questions run on every release: exact metric, comparison, trend, small sample, zero data, ambiguous, out of scope, adversarial text, cross-tenant probe, PII.

!

Blocks release

Any wrong number stated confidently, any non-verbatim quote, any cross-tenant leak, or guessing instead of disclosing uncertainty.

Success metrics (from the PRD)

MiniSense

Metric	Target
Numeric accuracy	100% on a standing test set
Narrative quality, human-rated	90% acceptable or better
Weekly adoption	1+ question per licensed user per week
Trust signal	Healthy viewed-evidence to flagged-wrong ratio
Cost per question	5 to 15 cents

Thank you for reading.

DISCLAIMER

MiniSense is my own PRD and prototype. The prototype screens use sample data (Northwind Retail). The RICE and 40-point plan come from a separate omniXM prioritisation exercise in the same package.
